

TFT Operation And Maintenance Manual Addendum, Model 9107B Series Composite STL Receivers.

IMPORTANT MANUAL CHANGES

This stereo composite receiver has been modified to provide a monaural audio output. A monaural demodulator board (P/N6608-4070) has been added to the mother board via J4 connector. The input of this circuit board is connected to the demodulated audio line of the receiver. The circuitry on this circuit board provides 15 kHz low pass filtering and balanced audio output. The balanced audio is available through J6, pin 3 and 4, on the rear panel of the receiver. The audio output level is adjustable by VR1 of the Monaural Demodulator Board.

THERE IS NO CHANGE REQUIRED IN OPERATING THE COMPOSITE STL TRANSMITTER WHEN IT IS USED FOR MONAURAL APPLICATIONS.
